

Cherry BX-2 Supplement # 2

Increased thickness of the brake-disc (ex. D 015, pos 12)

The brake disks can be build with a 5 mm thickness and mounted with an aluminum-ring (incl. 2 holes "Lücke" for both socket set screws M8) according to the sketch. Disk will heat up slower and reduce fading. Therefore the thicknesses of the brake pads need to be reduced to 3 mm or the aluminum-brackets need to be mounted with oblong holes 5 x 7 mm to the brake housing.
